GUARANTEED INCOME PRODUCING ASSET Stronger blend. Better retirement portfolios.

Retirement portfolios > higher values | higher income

Professional roasters blend coffees to create the distinctive, repeatable, flavour profiles discerning coffee drinkers enjoy. Similarly, clients value their adviser's expertise in blending solutions to deliver good outcomes for them too.

The careful construction of an investment portfolio from the many options available to achieve the best blend is a continuous challenge.

There's a guaranteed income producing asset available provided by our Secure Lifetime Income solution. So now you could create an even stronger blend and deliver better outcomes to your clients who are approaching or in-retirement.

Retirement portfolios > higher values | higher income

Important note: The projections shown are hypothetical and provided by Milliman using median returns. They're based on assumptions, not indicative of future performance and should not be the sole basis for investment decisions. Investment returns can fluctuate.

The example illustrations to the right and on the following pages provide an overview of how including a guaranteed income producing asset (GIPA) could improve the performance of a drawdown SIPP portfolio.

Enhancing a traditional 60:40 drawdown SIPP portfolio

In this first example, half the bond allocation of a traditional 60:40 equity/bond portfolio is replaced with a guaranteed income producing asset which generates an annual income of 6.71%. This enables the withdrawal rate on the other assets to be reduced to 3.32% per annum, whilst maintaining the 4% income target, and achieving a higher long-term portfolio value.

🕴 Equity 🛛 Bond 🛛 🛛 Guaranteed income producing asset (GIPA)

--- Traditional drawdown SIPP portfolio _____ New blended drawdown SIPP portfolio

Example based on 65 year old, male, in good health, non-smoker, with a £400,000 total portfolio value. Traditional drawdown SIPP portfolio scenario is based on 30% UK equities / 30% overseas equities / 10% Gilt / 30% UK corporate bond allocation. New blended drawdown SIPP portfolio scenario is based on £80,000 Secure Lifetime Income purchase, this equates to a blended model of 30% UK equity / 30% overseas equities / 20% UK corporate bond / 20% Secure Lifetime Income asset allocation, total fees of 1.75%.

Shielding income from portfolio volatility

This example considers a scenario where the primary objective is to meet income requirements following a defined benefit transfer.

In the solution, 45% of the traditional drawdown SIPP portfolio is replaced with a guaranteed income producing asset which generates the £12,000 income requirement. This enables the withdrawal rate on the remainder of the portfolio to be reduced to 0%.

The solution shields target income from portfolio volatility and enables higher long-term total portfolio value to be achieved.

– – – Traditional drawdown SIPP portfolio – New blended drawdown SIPP portfolio

Example based on 65 year old, male, in good health, non-smoker, with a £400,000 total portfolio value. Traditional drawdown SIPP portfolio scenario is based on 30% UK equities / 30% overseas equities / 10% Gilt / 30% UK corporate bond allocation. New blended drawdown SIPP portfolio scenario is based on £178,782 Secure Lifetime Income purchase, this equates to a blended model of 28% UK equities / 27% overseas equities / 45% Secure Lifetime Income asset allocation, total fees of 1.75%.

Creating better client outcomes

The example bars on the right and the next page illustrate the impact of allocating 20% of the initial portfolio value to purchase a guaranteed income producing asset at age 65, whilst maintaining flexibility on the remaining 80% of assets in the portfolio.

The new blended drawdown SIPP approach generates significantly higher projected long-term portfolio values, whilst also improving the probability of successfully achieving the target outcome of the portfolio.

Dependent on client objectives, alternatively, or in combination with achieving higher long-term portfolio values, more income could be taken than with the traditional drawdown SIPP portfolio approach.

Creating better client outcomes (continued)

The example bars on the right show the same scenario as the previous page. This time illustrating the percentage point improvements of the probability of the new blended portfolio maintaining annual target income over the traditional portfolio, at ages when the client has a reasonable chance of still being alive.

Traditional portfolio vs. New blended portfolio

A traditional drawdown approach gives each client an 18%–36% chance of running out of money at a 5% withdrawal rate, depending on how long they live and how markets perform. Of course, all clients experience the same actual market—but this framing helps bring the risk to life: if 100 clients followed this strategy, which 32 would potentially fall short?

By blending Secure Lifetime Income into the portfolio, we help improve the probability of success for the example ages shown to the right, and withdrawal strategies. This could mean fewer clients at risk, with failure rates reduced across the board.

The question is: how comfortable are you leaving your clients' retirement to chance?
